

ATTESTCREDIT · BUIDL CTC 2026 FALL

Your Aave repayment history, proven on Creditcoin

The cross chain credit bureau on Creditcoin, powered by the Attestcoin Protocol. No oracle, no bridge, no indexer.

PROBLEM

Credit history that cannot leave its chain is not credit history

Trapped

Billions borrowed and repaid on Aave, Compound and Morpho every month. Every repayment is public, permanent, and invisible to a lender on any other chain.

Untrusted

Today the only way to move that history is an oracle or an indexer that someone has to trust. Lenders do not price risk on hearsay.

Unbanked

Creditcoin's mission is portable credit for people banks cannot see. Their best credit data already lives on chain.

WHY NOW

Attestcoin makes a Creditcoin contract able to read Ethereum

Attestcoin readability is live on CC3

The block prover precompile verifies that a specific transaction was included in an attested Ethereum block, and hands the contract the receipt bytes. Batch proofs verify 10 transactions with one continuity proof.

Creditcoin has the lenders

Millions of credit transactions already recorded on Creditcoin, an ecosystem of lending apps, and a network whose founding purpose is exactly this data.

AttestCredit is the first project to use Attestcoin for what it was designed for: reading real financial behaviour from another chain, trustlessly.

PRODUCT

Import once. Score, passport and terms follow you.

1 · Ethereum Sepolia

You borrow and repay on Aave V3. The Pool emits Borrow, Repay and LiquidationCall with your address in the topics.

2 · Attestcoin

Creditcoin attests the block. The worker fetches a Merkle inclusion proof plus continuity proof from the proof builder and submits it.

3 · Creditcoin

CreditBureauASC verifies through 0x...0FD2, decodes the receipt, requires success and the real Pool, records the fact. The ledger recomputes your 300 to 850 score on the spot.

LIVE DEMO

Real Sepolia transactions become verified facts on Creditcoin

Proof trail

0xfa0888...bf7b · Borrow 400 USDC · #11655912
0xf5c966...2b29 · Repay 150 USDC · #11655920
0x932a80...5ff5 · Repay 100.003 USDC · #11655943
0xfe4b50...d27c · Borrow 250 USDC · #11655944
0x9e8c67...6d3e · Repay 150.002 USDC · #11655947

Seven transactions, one batch, one shared continuity proof.

What the judge sees in 60 seconds

Click Import → attestation wait → proof built → Creditcoin tx mined
→ score jumps → Passport mints → /lookup shows what any lender
sees → TieredLender terms change with tier.

Every gap the precompile leaves open is closed in code

Precompile does not	We do	Where
Check the tx succeeded	require receiptStatus == 1	CreditBureauASC.sol:149
Know which contract emitted a log	log.address == Aave Pool	:174 / :187 / :201
Restrict the source chain	chainKey == 1 before anything	:75 / :103
Prevent replay	keccak(chainKey height txIndex)	:78 / :111
Roll back your state	all or nothing batches, irrelevant txs consume nothing	:103–123, :162
Tell time	ledger clock = latest attested height (ChainInfo 0x...0fD3)	CreditLedger.sol:127

SCORING

Deterministic, on chain, explainable

```
base 300
+ min(repays, 40) × 6
+ min(bitlen(repaid USD), 12) × 8
+ clamp(repaid ÷ borrowed, 0, 1) × 80
+ min(weeks since first fact, 24) × 4
+ recency (30 d: 40 · 90 d: 20)
+ min(native repays, 10) × 5
- liquidations (90, +45 each, +60 recent)
- defaults × 120
clamp 300 ... 850
```

Tiers

Bronze <500 · Silver 500–649 · Gold 650–749 · Platinum ≥750

Price independent by design

Counts, ratio, tenure, recency and liquidations carry the score.
Volume uses fixed testnet scales and is secondary. Owner tunable parameters, fuzz tested monotonicity.

FOR LENDERS

One interface. One call. Five minutes.

```
interface ICreditOracle {  
    function getScore(address subject)  
        external view  
        returns (uint16 score, uint8 tier);  
}
```

```
(, uint8 tier) = BUREAU.getScore(user);  
if (tier == 3) ltv = 8000; // Platinum  
if (tier == 2) ltv = 7000; // Gold  
if (tier == 1) ltv = 5500; // Silver  
else          ltv = 4000; // Bronze
```

TieredLender (demo consumer)

CTC collateral, TUSD loans. LTV and APR read live from the oracle at borrow time. Repayments on Creditcoin feed the profile natively, no proof needed. Any Creditcoin lending app can do the same in under 40 lines.

Credit infrastructure, not another lending app

Go to market

Nigeria and emerging market stablecoin borrowers who already use Aave; launch alongside PenguinBase; integrate with Credal and the Creditcoin lender ecosystem so a Bronze to Gold move unlocks real terms.

Revenue

Per query fee for lenders reading the oracle at scale; premium passports (richer attributes, more source chains); enterprise underwriting feeds. Proof submission stays permissionless and free.

TEAM & ASK

Attestcoin was built to read credit across chains. This is that.

Team

big14way — smart contracts, Attestcoin integration, worker and app.
Shipped in six days on CC3 testnet with 41 passing tests, real Sepolia fixtures and measured gas.

Ask

Creditcoin Ecosystem Incentive Program support to take AttestCredit to Ethereum mainnet (chain key 3), add Compound and Morpho events, and ship the lender SDK.
